

KALMATRON® KF-C

Welding of Concrete

KALMATRON® KF-C is a fast hardening plug compound for stopping pressured leaks in the concrete, masonry, metal and wooden structures. KF-C plugs leaks with pressures up to 19 Bar with hand made patches “Hot Patch,” pressured air strewing “Welding”, and by hardened plugs. It is also applicable in underwater conditions with one of the shown techniques.

The drill to release the leak and space to plug it should open medium pressured leaks. Most of the leaks easier to stop by dry KF-C air pressured streaming into the leak as it shown at right.

For high-pressured leaks it is recommended to make from KF-C “mushroom” and “sausage” shaped plugs for plugging them into the holes and cracks respectively as it shown at left. Minor leaks are curable just by hand made “Hot Patch” with holding for 30 seconds.
